ABSTRACT OF THE DISCLOSURE

Print image data which is image developed from page-description-language data of a document of which a specified page is previously marked by an insert mark set in a client computer is held in an image server so as to sequentially add optional scan insert originals to a designated page position of the document consisting of plural pages at arbitrary timing using a scanner function at an image server side also for originals of which data is not previously digitized without converting original data into raster image data at a client side. Data of insert originals is input in real time by a scanner in a digital color copying machine, and then the data is print output to a page designated by the marking when the print image data is print output from the digital color copying machine.
